BIZSPHERE-UG

Database and Website Design Blueprint

Recommended data fields, linked directories and website structure

Prepared from BIZSPHERE SITE COMPONENTS - DEVELOPER.docx and the accompanying analysis.

23 October 2026 | Version 1.0

Main recommendation

Build BizSphere-Ug as a searchable business information platform with connected directories and structured detail pages. Help users move from a business idea to the machines, suppliers, funding, guidance and expertise needed to implement it.

The source document contains 10 numbered sections plus Business News and Updates. This blueprint preserves those areas and recommends a dedicated record type for investment opportunities, which the source includes under general business information.

How to use this document

Pages	Content
2-3	Requirements assessment and platform-wide database fields
4-13	Fields for all directories, including investment opportunities and news
14	Database relationships and supporting platform tables
15-17	Navigation, homepage, search, detail pages, mobile experience and access
18	Administration, delivery sequence and technical references

These are design recommendations, not collected business data or a final executable database schema. Field labels can be standardised during implementation. Numerical examples, projections and prices must be supported by evidence before publication.

02 Requirements assessment

The existing outline identifies the right kinds of information. The main improvements concern repeatable records, dated evidence and connections between directories.

Current requirement	Recommended change and reason
One price per machine	Separate specifications from supplier offers. The same machine can have different sellers, prices, warranties and delivery terms.
One funding source field	Separate providers, programmes and application rounds. Institutions can offer several funds with different terms and deadlines.
Minimum and maximum market prices	Create dated price observations with a product grade, unit, source and price type. Undated or incompatible prices can mislead users.
Ingredients and recipe steps	Store ingredient lines and numbered instructions separately to support scaling, costing and clear presentation.
Download links	Add file versions, ownership, access rules and review dates to reduce outdated information and broken downloads.
Verified listings	Record the scope, evidence, reviewer and date of each check. Contact checks and qualification checks mean different things.
Investment opportunities inside general information	Use dedicated opportunity records for capital requirements, terms, risks and supporting evidence.
Business news described as education and career news	Correct the description or create an explicit education category so the site scope remains clear.

Database principles

• Store repeatable information in linked child tables: offers, contacts, sources, ingredients, documents, prices and application rounds.

• Store amounts as numeric values with separate currency, unit, date and qualification fields. Keep unknown values empty with a reason; zero must mean zero.

• Use controlled categories and linked locations for filtering. Keep longer explanatory notes alongside structured values.

• Keep publication status, verification results and freshness separate. A published listing can have a checked contact but an outdated price.

• Distinguish source facts, editor explanations, estimates and promoter claims in both the database and the interface.

03 Fields shared across the platform

Create a Content Items table for common publishing fields. Link every specialised record to its content item. Use linked tables wherever a field can contain multiple categories, audiences, locations or evidence records.

Field group	Recommended fields
Identity	id, content_type, title, slug
Introduction	short_summary, overview
Classification	primary_category_id; linked subcategories, industries and tags
Audience	Linked target audiences and business stages
Geographic relevance	Linked eligible countries or locations; coverage_notes. Distinguish applicability from the provider location.
Publishing	publication_status, published_at, created_at, updated_at, created_by, reviewed_by
Freshness	last_reviewed_at, next_review_due_at, expires_at where applicable
Access	access_level and linked access entitlements

Shared supporting records

Record	Recommended fields
Source	source_id, publisher_name, source_title, source_url, source_published_at, accessed_at, source_type
Evidence link	content_item_id, source_id, claim_supported, evidence_notes
Media asset	asset_id, file_location, media_type, caption, alt_text, credit, usage_permission, display_order
Verification check	check_id, content_item_id, check_type, result, checked_at, checked_by, evidence_reference, review_due_at
Related content	from_item_id, to_item_id, relationship_type, editorial_notes

Use appropriate numeric, date/time, Boolean and foreign-key types. Store phone numbers as text. Use stable identifiers for units and currencies. Define required fields and conditional rules for each record type during implementation.

04 Business Ideas and Plans

Purpose: help users understand the business, assess whether it suits them and identify the resources needed to start.

Field group	Recommended fields
Business concept	idea_name, business_model, products_or_services, customer_problem, value_proposition
Suitability	business_type_id, linked industries, experience_level, required_skills, owner_time_commitment, location_requirements
Market	target_customers, demand_evidence, competitor_notes, sales_channels, seasonality
Implementation	Numbered startup steps; linked equipment; premises and staffing requirements; licences or registrations to investigate
Startup budget	Linked budget scenarios and budget lines
Operating economics	Operating costs, selling-price assumptions, sales-volume assumptions and working-capital requirements
Practical assessment	success_factors, major_risks, risk_reduction_actions, growth_options
Supporting resources	Linked plans, tools, guides, machines, suppliers, funding and consultants

Budget Scenarios and Budget Lines

Record	Recommended fields
Budget scenario	Scenario name, currency, location, estimate date, assumptions, operating scale and supporting evidence
Budget line	Cost category, item description, quantity, unit, unit cost, frequency, one-time or recurring status, source and contingency treatment

Presentation recommendation

Where evidence allows, show low, standard and higher-investment scenarios. Calculate totals from budget lines. Display the assumptions behind any profit or break-even estimate.

Useful filters

Industry, startup budget, location, required experience, home-based suitability and business stage.

05 Business Machines

Separate machine identity and specifications from supplier offers. A machine can have several dated offers from different sellers.

Record or group	Recommended fields
Identity	machine_id, machine_name, manufacturer, brand, model_number, machine_category_id, machine_type
Applications	function, materials_processed, products_produced, linked industries and business ideas
Performance	capacity_min, capacity_max, capacity_unit, capacity_basis, automation_level, operators_required
Installation	power_source, rated_power_kw, voltage, phase, dimensions, weight, space and installation requirements
Operation	Consumables, maintenance requirements, spare-parts notes, training requirements and safety instructions
Media	Photos, demonstration videos, manuals and technical specification documents
Supplier offer	offer_id, machine_id, supplier_id, condition, price_min, price_max, currency, minimum_order, availability_status
Offer terms	Tax treatment, delivery coverage and charge, lead time, warranty, installation support, training support, quotation link, quotation date and validity

Variable specifications

Use linked specification attributes for requirements that differ across machine categories. A grain mill and a sewing machine should not be forced into identical technical fields.

Price presentation

Distinguish the quoted purchase price from an estimated delivered and installed cost. Record freight, taxes, installation and exchange-rate assumptions separately when calculating the latter.

Useful filters

Function, industry, capacity, power requirements, price, condition, supplier location and local support.

06 Suppliers

A supplier can sell many products and operate from several branches. Store the organization once and link its locations, contacts and listings.

Field group	Recommended fields
Identity	supplier_id, organization_id, trading_name, legal_name, supplier_type
Profile	Company description, industries served, years established where confirmed, business registration reference
Locations	Country, district or region, town, physical address, branch records and optional coordinates
Contacts	Contact person, role, business email, business phone, WhatsApp number, website and preferred contact method
Products	Linked product categories and supplier product listings, brands supplied and specifications
Commercial terms	Minimum order, wholesale or retail availability, payment methods, delivery areas, lead time and returns policy
Service capability	Installation, maintenance, training, spare parts and export capability
Trust evidence	Registration, address and contact checks; check dates; evidence; listing-claim status

Supplier Product Listings

Fields: id, supplier_id, product_id, product_name, specifications, unit, minimum_order_quantity, availability, price_min, price_max, currency, quoted_at and valid_until.

Where the product is a machine, link the machine record rather than creating a second machine description. Use a distinct supplier offer for that machine.

Verification labels

Use precise labels such as Business contact checked on [date]. A checked contact does not guarantee product quality or delivery.

Useful filters

Product, manufacturer/distributor/retailer, location, delivery coverage, minimum order and verification type.

07 Funding Sources

Use Funding Providers, Funding Programmes and Application Rounds. Keep filterable eligibility criteria alongside the full provider wording.

Record or group	Recommended fields
Provider	provider_id, organization_id, provider_category, country, website and official contacts
Programme	programme_id, provider_id, fund_name, funding_type, purpose and supported business stages
Eligibility	Eligible countries, sectors, business types, registration, operating history, turnover and applicant requirements
Amount	Minimum amount, maximum amount, currency, amount basis and matching contribution requirements
Loan terms	Interest rate and rate basis, fixed/variable status, fees, repayment period and frequency, grace period, collateral and guarantor requirements
Grant terms	Eligible expenses, matching funds, milestones, reporting requirements and restrictions
Equity terms	Investment range, ownership terms where disclosed, investment instrument, governance requirements and selection criteria
Application round	Opening date, closing date/time and time zone, rolling-application flag, round status, application URL, required documents and process
Evidence	Official terms URL, terms version/date, last checked date and contact-confirmation notes

Amount terminology

Replace Amount Given with Funding Amount or Range. An advertised ceiling is not an amount an applicant is guaranteed to receive.

Useful filters

Loan/grant/equity, sector, business stage, amount, collateral requirement, eligibility and application status.

08 Guidelines and Investment Opportunities

Business Information and Guidelines

Field group	Recommended fields
Identity and applicability	resource_id, title, resource_type, business-process category, country/jurisdiction, responsible authority, audience and applicable business types
Procedure	Purpose, prerequisites, numbered steps, required documents, submission channel and expected outcome
Costs and time	Official fee, currency, fee basis, processing-time estimate, date checked and source
Authority and dates	Author or issuing body, publication date, effective date, version and superseded status
Access	Official URL, download asset, video link, language, file format and size
Editorial value	Plain-language summary, practical notes, common mistakes, related tools and contacts

Use child tables for Steps, Required Documents and Fees. Separate official instructions from BizSphere explanations. Link tax and registration guidance to its original authority and review date. Filters: process, industry, jurisdiction, format and business stage.

Dedicated Investment Opportunity records

Field group	Recommended fields
Opportunity	Name, type, promoter, sector, location and project description
Capital	Capital sought, currency, minimum participation and intended use of funds
Terms	Proposed investment structure, investor rights, revenue model, term and exit arrangements
Assessment	Business stage, available financial evidence, assumptions, risks and independent evidence
Application	Opening date, deadline, process, contact and required documents
Documents and claims	Proposal, financial projections, supporting records and dates; promoter return claims, calculation basis and verification status

The source includes investment opportunities under general information. A dedicated record type makes their specific terms inspectable. Attribute promoter claims clearly; projected returns are not established outcomes.

09 Business Consultants and Experts

Separate a consultant profile from their services, credentials and reviews. Link the person to their organization where applicable.

Field group	Recommended fields
Identity	consultant_id, full_name, professional_title, profile_summary, photograph and organization link
Expertise	Specialties, industries served, business stages served and languages
Qualifications	Qualification, awarding institution, professional membership and registration reference where applicable
Services	Service name, description, deliverables, delivery mode and geographic coverage
Experience	Relevant experience, selected projects, case studies and client references where publication is permitted
Fees	Fee amount/range, currency, pricing basis, consultation duration and quotation-required flag
Availability	Availability status, preferred contact method and response-time expectation
Contact	Country, district, business email, phone, website and booking/enquiry link
Evidence	Identity, credential or professional-registration checks and dates

Verification and reviews

Keep profile verification separate from service reviews. If reviews are introduced, record whether they relate to a confirmed engagement and provide moderation.

Useful filters

Specialty, industry, location, language, delivery mode and pricing basis.

10 Cooking Recipes

Support both cooking instructions and business use cases such as catering, food production, batch costing and portion pricing.

Record or group	Recommended fields
Recipe	Name, category, description, cuisine, skill level and equipment requirements
Yield and time	Yield quantity, yield unit, servings, preparation time, cooking time and total time
Ingredient line	Ingredient ID/name, quantity, measurement unit, preparation note and optional substitute
Instruction step	Step number, instruction, duration, temperature where applicable and image/video segment link
Food information	Allergens, dietary labels, storage instructions, shelf-life conditions and evidence
Commercial costing	Costing date, location, currency, ingredient prices, packaging, energy, labour, wastage and batch cost
Selling assumptions	Portion size, portions per batch, proposed selling price and margin calculation
Media	Recipe images, full video, video duration and transcript

Costing structure

Keep the base recipe separate from dated costing scenarios. Calculate cost per portion from the yield and selected scenario. Preserve the quantities and unit conversions used.

Evidence requirement

Do not publish shelf-life claims without appropriate supporting information. Show the location and date used for ingredient costs.

Useful filters

Recipe category, ingredient, equipment, preparation time, yield and estimated batch cost.

11 Business Tools and Templates

Distinguish downloadable templates from interactive calculators. Each needs instructions, versioning and clear usage conditions.

Field group	Recommended fields
Identity	tool_id, tool_name, tool_type, category, purpose and intended user
Instructions	Description, required inputs, usage steps, worked example and limitations
Compatibility	File format, supported software, device requirements, editable flag and macros-present flag
Versioning	Version number, release date, change notes and superseded status
Calculator rules	Formula/rule version, input definitions, units, output definitions, rounding rules and assumptions
Jurisdiction	Applicable country, effective date, official rule source and next review date
Access	Download asset or calculator route, access level, licence and publisher
Validation	Test cases, expected outputs, last validated date and validator

Tax and rule-based calculators

Store the effective date and version of the calculation rules. Previous calculations should remain tied to the rules used at the time.

Useful filters

Calculator/template/checklist, business function, format, jurisdiction and compatible software.

12 Markets and Prices

Use separate Markets, Products and Price Observations tables. Keep historical observations rather than replacing yesterday's price.

Record or group	Recommended fields
Market	market_id, market_name, market_type, country, district, town, address, operating days and contact
Product	product_id, name, local names, category, variety, grade, packaging and standard measurement unit
Observation identity	observation_id, market_id, product_id, observation date/time and collection date/time
Price	Minimum price, maximum price, currency, quoted unit, quantity basis and retail/wholesale/farm-gate classification
Comparability	Product condition, grade, package size, evidenced conversion factor and tax/transport inclusion
Evidence	Source, collection method, number of quotes where known, collector, verification result and notes

User-facing price display

Show Observed on [date] beside every price. Include the product grade, quantity basis and price type. Make missing or stale information visible.

Comparison rule

Do not compare a bag of rice across markets without establishing bag weight and product grade. Apply unit conversions only where their basis is known.

Useful filters

Product, variety, grade, market, district, price type, unit and observation date.

13 Useful Websites and Business News

Useful Websites

Field group	Recommended fields
Identity	website_id, site_name, canonical_url, operator/organization
Classification and value	Type, category, industries, audience, main function, available resources, business use case and editorial explanation
Coverage	Countries served, eligibility restrictions and languages
Access	Free/paid/freemium, pricing URL, account-required flag and restrictions
Trust and maintenance	Official-site status, ownership evidence, editorial assessment, last link check, last content review, redirect destination and availability status
Connections and commercial terms	Linked guides, funds, tools and other records; affiliate flag and disclosure text where applicable

Link a website to the funding programmes or tools it hosts. Avoid maintaining conflicting copies of the same terms. Filters: purpose, industry, geography, language and access cost.

Business News and Updates

Field group	Recommended fields
Article	article_id, headline, standfirst, article_body, category
Attribution	Author, publisher, original URL, source links and image credits
Dates	Published date, updated date, event date and effective date where relevant
Relevance	Countries, industries, affected business types and related organizations
Practical value	What changed, who is affected and suggested next action
Classification and connections	News/report/analysis/opinion, correction status, update notes and links to related funds, guidelines, opportunities, products or markets

Keep publication dates separate from the date a rule, event or deadline takes effect. Correct the source document's education/career wording if this section is intended for business news.

14 Database architecture and relationships

Use a relational foundation with a shared publishing layer and specialised tables. The following relationships allow users to move between useful resources without duplicating the underlying data.

Relationship	Recommended structure
Content and specialised data	One content item has one matching specialised record, such as a machine, recipe or funding programme.
Organizations and roles	One organization can act as a supplier, funding provider and consultancy.
Machines and sellers	One machine can have many supplier offers.
Ideas and resources	One idea can link to many machines, guides, programmes and experts through relationship tables.
Funding	One provider has many programmes; one programme has many application rounds.
Recipes	One recipe has many ingredients, steps and costing scenarios.
Market prices	One product has many observations across markets and dates.
Sources and claims	One item can cite several sources; a source can support multiple items.
Categories	Many-to-many links allow content to belong to more than one category.

Recommended database option

PostgreSQL is a suitable starting option: it supports relational constraints, full-text search and indexed JSON fields for variable specifications. Keep frequently filtered fields such as price, district, capacity and deadline in structured columns. Use JSON selectively for category-specific attributes. See technical references 1-3.

Additional platform tables

- Users, roles and editorial permissions; saved items, collections and saved searches.
- Submissions, correction reports, moderation history, file assets and document versions.
- Memberships, payments and access entitlements when subscriptions are enabled.
- Search and usage events to evaluate what information visitors need.

Use foreign keys, uniqueness rules and validation constraints. For example, prevent a minimum price exceeding its maximum, preserve quotation dates and validate links to existing providers and products.

15 Navigation and homepage structure

Organise navigation around user goals while preserving each individual directory. Keep News, About, Help, Membership and Sign in in secondary navigation.

Main navigation	Contents and user goal
Start a Business	Business ideas, plans and startup budgets: decide what to do and how to begin.
Machines and Suppliers	Machine and supplier directories: find equipment and sources.
Funding and Opportunities	Funding programmes and investment opportunities: find suitable finance or participation opportunities.
Guides and Tools	Procedures, books, videos, calculators, templates, recipes and useful websites: complete a business task.
Markets and Prices	Markets, commodities and price history: find markets and compare dated prices.
Find an Expert	Consultants and professional services: obtain specialist help.

Homepage from top to bottom

Section	Recommended contents
Header and search	Logo, navigation, account access and membership; search prompt: What do you want to start, find or solve? Optional content-type selector.
Task shortcuts	Find an idea, find a machine, find funding, check prices and get guidance.
Business ideas	Selected ideas with budget basis/date, industry and practical requirements.
Machines and suppliers	Selected records with specifications, location and dated offer information.
Funding and markets	Open programmes with eligibility/deadlines; selected dated market observations.
Guides, tools and news	Practical resources followed by relevant business changes.
Footer	About, contact, corrections, terms, privacy and content methodology.

Keep recipes distinct within Guides and Tools and link them prominently from food businesses. Avoid autoplay video and large rotating banners. Give search and useful information most of the space.

16 Search results and detail pages

Use one global search and specialised filters within each directory. A search for start a bakery should connect an idea, ovens, flour suppliers, funding, recipes, a costing template and guidance.

Content type	Information visible on a result card
Business idea	Name, industry, budget range/date and experience requirement
Machine	Image, name/model, capacity, power requirements and offer price basis
Supplier	Name, products, location and specific verification checks
Funding	Programme, type, amount range, eligibility summary and deadline
Guide	Title, process, jurisdiction and last review date
Consultant	Name, specialty, location and delivery mode
Recipe	Name, yield, preparation time and costing date if shown
Tool	Name, purpose, format and current version
Market price	Product, grade, market, unit, price type and observation date
Website	Name, purpose, geography and free/paid status
News	Headline, publisher, publication date and affected sector

Provide Save, View details and Compare where appropriate. Compare only compatible values: matching capacity units for machines, and matching grade and quantity basis for market prices.

Consistent detail page structure

1. Identity: title, category, image and summary. 2. Key facts: the most important attributes for this content type. 3. Practical detail: requirements, specifications, steps or terms. 4. Evidence: sources, dates and verification scope. 5. Action: download, official application, supplier contact or enquiry. 6. Connected resources: related ideas, machines, funding, guides and experts.

Use the business idea page as a central connection point. A juice business page should bring together steps, a dated budget, equipment, suppliers, recipes, guidance and costing tools.

Publish useful category pages and readable detail URLs, such as /business-ideas/, /machines/ and /funding/. Control crawlable filter combinations to avoid excessive URLs. See technical reference 4.

17 Mobile design and membership access

Visual and mobile experience

• Use light backgrounds, dark readable text and one consistent primary brand colour.

• Use clear category icons and real product images where useful. Start with short summaries and allow users to expand detail.

• On desktop, place filters beside results. On mobile, provide a prominent Filter button and a drawer, with selected filters visible above results.

• Compress images, load them lazily and load videos only when requested.

• Use large touch targets, labelled controls and clear form errors. Keep search visible on major pages.

• Provide an alternative contact option wherever a WhatsApp action appears.

Recommended page types

Homepage; directory landing pages; global search; structured detail pages; compatible-item comparisons; member dashboard; contributor dashboard; and administration.

Member dashboards should include saved resources, collections, alerts and account details. Contributor dashboards should show submitted listings, correction requests and review status.

Access model if subscriptions are enabled

Role or access level	Recommended experience
Public visitor	Browse categories, read useful previews and inspect source/freshness information.
Registered user	Save items and create collections.
Subscriber	Access the detailed resources, downloads and tools included in their plan.
Contributor	Submit listings and corrections for review.
Editor	Research, verify, edit and publish content.
Administrator	Manage roles, memberships and platform settings.

Enforce access on the server, including file downloads and API responses. Hiding content in the browser does not protect the underlying information. Define plan entitlements explicitly; no subscription prices are set by this blueprint.

18 Administration and delivery sequence

Administration requirements

Provide dedicated entry forms, duplicate checks, evidence requirements, draft/review/published/archived states, review queues, broken-link reports, funding expiry handling, stale-price indicators, change history and correction workflows. Preview and validate bulk imports before publication.

Recommended implementation sequence

Stage	Build and completion condition
1 Foundation	Categories, organizations, sources, media, users, publishing and search. Records can be entered, linked, reviewed and retrieved reliably.
2 Core journey	Ideas, machines, suppliers, funding, guides and basic experts. A user can research an idea and find requirements and contacts.
3 Resources	Tools, websites, recipes, news and investment opportunities. Each has suitable fields and evidence rules.
4 Price information	Markets, products and historical observations. A dependable collection and review process is operating.
5 Member features	Collections, comparisons, subscriptions, access controls and alerts. Payment and access states work across pages, APIs and downloads.

Acceptance test

A user selects an idea, examines its dated budget, finds compatible machines and suppliers, checks suitable funding and saves the resources needed to act. Validate this complete journey before launch.

Sources and technical references

Primary project source: BIZSPHERE SITE COMPONENTS - DEVELOPER.docx, supplied by the user. The field expansion, navigation, access model and delivery sequence are recommendations from the accompanying analysis.

1. PostgreSQL documentation - Constraints
https://www.postgresql.org/docs/current/ddl-constraints.html

2. PostgreSQL documentation - Full Text Search
